12 pages analysed · 0 broken links · 4 distinct issues

HOW TO READ THIS REPORT

One score. Four perspectives.

The overall score is an equal-weighted view of security, accessibility, SEO and performance. Findings are grouped by rule so the same issue on several pages is counted once.

Use the following pages to understand the evidence, identify affected URLs and plan the next fix. Re-run the audit after deploying changes to measure progress.

Findings

HIGH Images missing alternative text

Accessibility

Three informative images have no alt attribute. People using a screen reader cannot access the information in these images.

Recommendation: Add concise, descriptive alternative text to informative images. Use an empty alt attribute only for decorative images. Check the affected pages with a screen reader.

Affected: <https://example.com/about>, <https://example.com/work>, <https://example.com/contact>

MEDIUM Referrer policy is not configured

Security

The response does not declare a Referrer-Policy header. Browser defaults apply, but an explicit policy makes the intended behaviour clear.

Recommendation: Review the referrer information your site needs to send, and configure an appropriate Referrer-Policy header. Verify the response after deployment.

Affected: <https://example.com/>

MEDIUM HTML response is larger than expected

Performance

The sample document contains a large inline data block. The response transfers more content than the initial view requires.

Recommendation: Inspect the initial document payload. Defer data that is only needed after interaction, preserving the content required for the first render. Measure again on the same connection profile.

Affected: <https://example.com/work>

LOW Meta description needs a clearer summary

Seo

The sample page has a very short meta description. It does not clearly describe the page's purpose.

Recommendation: Write a concise, specific summary of this page. Keep it unique and useful to a person deciding whether to visit from search results.

Affected: <https://example.com/about>

Recommendations

01 / accessibility

Images missing alternative text

Add concise, descriptive alternative text to informative images. Use an empty alt attribute only for decorative images. Check the affected pages with a screen reader.

02 / security

Referrer policy is not configured

Review the referrer information your site needs to send, and configure an appropriate Referrer-Policy header. Verify the response after deployment.

03 / performance

HTML response is larger than expected

Inspect the initial document payload. Defer data that is only needed after interaction, preserving the content required for the first render. Measure again on the same connection profile.

04 / seo

Meta description needs a clearer summary

Write a concise, specific summary of this page. Keep it unique and useful to a person deciding whether to visit from search results.

Methodology & limitations. Scores start at 100 per category and are reduced per grouped finding (critical –25, high –15, medium –7, low –3). These are automated checks: accessibility results do not certify WCAG compliance, and security results are passive configuration checks, not a penetration test.
